

Reporting and Analytics Features for Web Browser and Mobile Users

INFORMATION WHERE IT COUNTS

NGS-IQ™ from New Generation Software, Inc. (NGS) provides secure Web browser and mobile access to your enterprise data. You can generate easy-to-read, attention-getting, formatted output in popular file formats – including HTML reports with tables, charts, hyperlinks, and other design elements.

Users enjoy high performance and reliability thanks to NGS-IQ's use of IBM® i's integrated Apache HTTP Server. No JDBC or ODBC is required to process requests. Security is controlled from IBM i, not from a separate server or operating system.

Description	Quantity
COURT SPECIALIST	6,250
CROSS TRAINER	8,450
HIKING BOOT	5,880
RUNNING SHOE	14,895
SOCCER SHOE	5,160

On Demand and Archived Report Access

NGS-IQ supports mobile and Web browser users' on-demand, real-time query needs with secure access to reports as well as output stored on your company's Web server or IBM i's Integrated File System (IFS).

NGS-IQ's integrated WebRunner feature lets authorized users run queries from their browser and output them to HTML, Adobe PDF, and Microsoft® Excel.

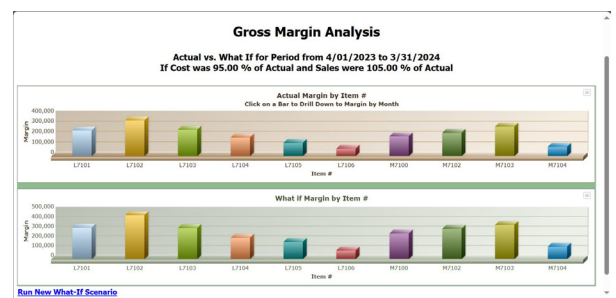

Report Distribution

NGS-IQ's email and FTP output distribution features can automate the delivery of reports and other data from IBM i to authorized users in XLSX, PDF, HTML, CSV, TXT, and XML format.

Reports can either be attached to an email message or stored in a secure folder. You can optionally send notification messages to one or more email addresses when a report is ready to access.

Web Development Without the Language Barrier

Query developers can use the extensive HTML design features of NGS-IQ's *IQ Client*™ module to create virtually any report layout without writing HTML, Java, or PHP programs.

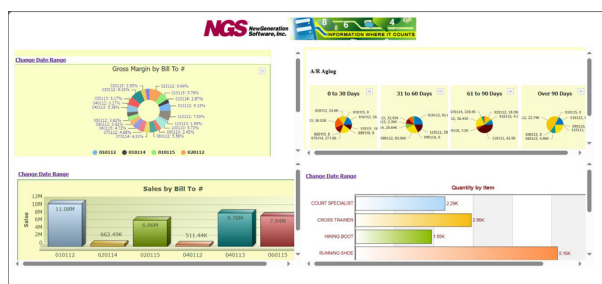

IQ Client's point-click, drag-drop development interface makes it easy to add images, two-dimensional and three-dimensional charts, and drill-down hyperlinks as well as apply your own cascading style sheets. Even beginners can produce effective presentations.

Portal and Intranet Reporting

Web developers can use *NGS-IQ* to add real-time query processing to their portals and Web pages by embedding *NGS-IQ* WebRunner keywords in their pages. Among the variables these English language-like keywords let you control are query name, library, run-time input parameters, and the file format of the output.

Cross-Platform and Remote Database Access

With the optional *IQ Connexion™* cross-platform database access module of *NGS-IQ*, you can design reports that combine data from multiple data sources such as Microsoft SQLServer®, Oracle®, MySQL®, PostgreSQL™, and Db2® on other IBM platforms.

Security

NGS-IQ enforces your existing IBM i security settings and also lets you further control access to data, queries, and query functions through the *IQ SeQure™* module.

The query inventory feature of the *IQ SeQure™* module helps you document your queries with extended descriptions and keywords. You can perform text searches over this information to locate previously developed queries that might be able to satisfy or provide a good starting point for responding to a new request. The query inventory feature promotes consistency and reduces development time.

Tutoring

NGS offers customers and business partners technical support and online tutoring services.

We strongly encourage new customers to take advantage of our staff's experience and the many hours of video tutorials and Webinar playbacks provided for on-demand viewing at www.ngsi.com.

About NGS

NGS was incorporated in 1982 and is a privately held company based in Sacramento, California, USA. The company is an IBM Business Partner and supports customers of all sizes, across all industries.
