

Have the Best of Both Worlds: *Business Intelligence and Data Security*

There's tremendous business and operational benefit in providing your managers and departmental users with timely access to your application data. But today's regulatory mandates and auditor's compliancy requirements may now demand that their use of business intelligence and query tools needs to be closely monitored or restricted. The *IQ SeSure™* security management module of *NGS-IQ™* gives you the ability to balance their need for access with the need for optimal control.

IQ SeSure was designed to work hand-in-hand with IBM's i5 OS and OS/400 security but then lets you also control DB2 access at the field and record by user. And with record level control, a single query can serve the reporting needs of multiple users – different users will receive different records based on their authority, saving you hours in query modifications.

You can secure queries against unauthorized modification and execution. You can also control who has authority to take advantage of functions and modules within the *NGS-IQ* business intelligence product line, such as: e-mail, FTP, and downloads of data to PC applications using the *NGS-IQ* client *Qport Access™* for direct outputs to Windows applications.

The icing on the cake is its quick implementation and maximum flexibility – all without programming!

In addition, the *NGS-IQ* business intelligence products:

- Do not use ODBC to connect to your database
- Will not allow your users to overwrite a previously created query
- Come with thorough documentation your auditors will appreciate

Schedule a no-cost Web demonstration to see how *NGS-IQ* and *IQ SeSure* can satisfy your users' reporting requests while ensuring your auditors, Sarbanes Oxley, and other compliancy requirements are fulfilled.

Precoat Metals

Diane Nestleroad, Director Information Technology

A primary reason Precoat Metals, one of the largest coil coaters in the world, selected New Generation Software's *NGS-IQ* business intelligence product line was because the software met their Sarbanes-Oxley requirements. The *IQ SeSure* security module allows Precoat Metals to control access to sensitive data stored in their homegrown business applications on their IBM System i. *IQ SeSure* permits them to lock down users' access to specific libraries, fields, and records when developing reports using *NGS' IQ Server* and *Qport Builder* query development modules and the subsequent output of these queries, such as to Lotus and Excel spreadsheets, *NGS' OLAP* module, and more. In addition, the query development modules will not allow users to overwrite a file. A side benefit realized was in the area of productivity; since *SeSure* allows them to be selective of data access and output by user profile, they can create just one query – rather than numerous queries – that can meet the reporting needs of their corporate executives, managers, and departmental users alike.
