

Improving Your Query Development Skills

NGS-IQ provides many functions to help you transform, select, format, and output data. Whether you've written many queries or recently inherited responsibility for your company's queries, we think you'll gain some new skills as we take a deep dive into important and often misunderstood functions that can help you:

- calculate running totals
- count unique occurrences
- create one-to-many table joins
- set and retrieve *NGS-IQ* Environment Variables (EVars)

If time permits, we'll cover other topics that have surfaced in recent discussions. Please register and add this webinar to your calendar.
